

The McCORMICK- DEERING HEAVY HAY RAKE

is specially designed for raking heavy hay crops, ensilage or stubble. Its heavy Tynes closely follow the ground and rake cleanly under all conditions.

The heavily tyred wheels have staggered spokes and are fitted with renewable hubs and roller bearings which reduce draft. The shafts are adjustable for any sized horse and the trip rods and wheel ratchets are reversible, doubling their life. A special feature of the dumping gear of this Rake is that when tripped — if desired — the tynes remain lifted. This is a distinct advantage when cocking hay or raking heavy crops as without this feature the tynes would fall before the Windrow was cleared.

The well known McCormick-Deering Light Rake with heavy double coil Tynes is available in two sizes, 8 ft. and 9 ft.
